# Geometria differenziale. - Induced and intrinsic derivatives on the subspace of special Kawaguchi space. Nota di Udai Pratap Singh e Shri Krishna Deo Dubey, presentata ${ }^{(*)}$ dal Socio E. Bompiani. 

#### Abstract

Riassunto. - Nella teoria degli spazi speciali di Kawaguchi esistono due tipi di connessione (indotta e intrinseca) su una varietà immersá (come nella geometria di Finsler). La loro differenza è stata determinata da Yoshida [2] (1).

In questa Nota si definiscono e studiano due tipi di vettori normali di curvatura. Si discutono inoltre i due tipi di parallelismo di un campo vettoriale.

## i. Introduction

We shall consider an $n$-dimensional metric space $\mathrm{K} n$ in which the arc length of a curve $x^{i}=x^{i}(t)^{(2)}$ is given by following integral:

$$
\begin{equation*}
\mathrm{S}=\int\left[\mathrm{A}_{i}\left(x^{i}, x^{i}\right) \ddot{x}^{i}+\mathrm{B}\left(x^{i}, x^{i}\right)\right]^{1 / t} \mathrm{~d} t, \tag{I.I}
\end{equation*}
$$

where

$$
x^{\prime}=\frac{\mathrm{d} x^{i}}{\mathrm{~d} t} \quad, \quad \ddot{x}^{i}=\frac{\mathrm{d}^{2} x^{i}}{\mathrm{~d} t^{2}}
$$

and $\mathrm{A}_{i}, \mathrm{~B}$ are differentiable functions of $x^{i}$ and $x^{i}$. If $p=3, n$ is even then the space $\mathrm{K} n$ is called an $n$-dimensional special Kawaguchi space of order 2. The theory of such a space was established by A. Kawaguchi [I] and was studied by several authors.

In order that the arc length in the space should remain unaltered under any transformation of the parameter $t$, we must have the so-called Zermelo's conditions,

$$
\begin{equation*}
\mathrm{A}_{i} x^{\prime i}=0 \quad, \quad \mathrm{~A}_{i(j)} x^{j}=(p-2) \mathrm{A}_{i} \quad, \quad \mathrm{~B}_{(i)} x^{i}=p \mathrm{~B}, \tag{1.2}
\end{equation*}
$$

where

$$
\mathrm{A}_{i(j)}=\frac{\partial \mathrm{A}_{i}}{\partial \dot{x}^{i}} \quad, \quad \mathrm{~B}_{(i)}=\frac{\partial \mathrm{B}}{\partial \dot{x}^{i}} .
$$

And, since (I.I) is scalar, it follows that $\mathrm{A}_{i}$ is a vector.
Let us consider an $m$-dimensional subspace $\mathrm{K} m$ of $\mathrm{K} n$ represented by the equations $x^{i}=x^{i}\left(u^{\alpha}\right)$ and the matrix of the projection factors $p_{\alpha}^{i}=\frac{\partial x^{i}}{\partial u^{\alpha}}$ has rank $m$. If we denote $a_{\alpha}$ and $b$ the quantities in $\mathrm{K} m$ corresponding to $\mathrm{A}_{i}$
(*) Nella seduta del 12 maggio 1973.
(I) Numbers in the brackets refer to the references at the end of the paper.
(2) Throughout this paper, Latin indices run from I to $n$, Greek ones $\alpha, \beta, \gamma, \delta, \varepsilon$ from I to $m$ and $\mu, \nu$ from $m+\mathrm{I}$ to $n$.
and B in $\mathrm{K} n$ respectively, it follows that the same equations concerning $a_{\alpha}$ and $b$ as (I.2) hold.

Putting

$$
\begin{equation*}
\mathrm{G}_{i j}=2 \mathrm{~A}_{i(j)}-\mathrm{A}_{j(i)} \quad, \quad \mathrm{G}_{\alpha \beta}=2 a_{\alpha(\beta)}-a_{\beta(\alpha)} \tag{I.3}
\end{equation*}
$$

it has been shown ([2]),

$$
\begin{equation*}
\mathrm{G}_{i j} p_{\alpha}^{i} p_{\beta}^{j}=\mathrm{G}_{\alpha \beta} . \tag{I.4}
\end{equation*}
$$

Suppose $G^{\alpha \beta}$ is the tensor reciprocal to $G_{\alpha \beta}$ (i.e. $G^{\beta \alpha} G_{\beta \gamma}=\delta_{\gamma}^{\alpha}$ ) Yoshida [2] defines

$$
\begin{equation*}
p_{i}^{\alpha}=\mathrm{G}^{\alpha \beta} \mathrm{G}_{i j} p_{\beta}^{j} \tag{I.5}
\end{equation*}
$$

on the assumption that $n, m$ are both even and $\operatorname{det}\left(\mathrm{G}_{i j}\right)\left\{\operatorname{det}\left(\mathrm{G}_{\alpha, \beta}\right)\right\}$ does not vanish identically. It is easy to show that

$$
p_{i}^{\alpha} p_{\beta}^{i}=\delta_{\beta}^{\alpha} .
$$

The connections $\Gamma^{i}$ of $\mathrm{K} n$ and $\Gamma^{\alpha}$ of $\mathrm{K} m$ are given as

$$
\begin{equation*}
2 \Gamma^{i}=\left(2 \mathrm{~A}_{l m} \dot{x}^{m}-\mathrm{B}_{(l)}\right) \mathrm{G}^{l i} \quad, \quad 2 \Gamma^{\alpha}=\left(2 a_{\beta \gamma} \hat{u}^{\gamma}-b_{(\beta)}\right) \mathrm{G}^{\beta \alpha} . \tag{土.6}
\end{equation*}
$$

The covariant differential of a contravariant vector field $v^{i}\left(x^{i}, x^{i}\right)$ homogeneous of degree zero with respect to the $\dot{x}^{i}$ is defined by Kawaguchi [ I ]

$$
\begin{equation*}
\delta v^{i}=\mathrm{d} v^{i}+\Gamma_{j k}^{i} v^{j} \mathrm{~d} x^{k} \tag{1.7}
\end{equation*}
$$

where

$$
\Gamma_{j k}^{i}=\frac{\partial^{2} \Gamma^{i}}{\partial x^{j} \partial x^{\prime k}}=\Gamma_{k j}^{i}
$$

If $v^{\alpha}$ is a vector field in $\mathrm{K} m$ such that $v^{i}=p_{\alpha}^{i} v^{\alpha}$, then the induced covariant differential $\check{\delta} v^{\alpha}$ is defined as (Yoshida [2])

$$
\begin{equation*}
\check{\delta} v^{\alpha}=p_{i}^{\alpha} \delta v^{i} \tag{1.8}
\end{equation*}
$$

Putting

$$
\check{\delta} v^{\alpha}=\mathrm{d} v^{\alpha}+\check{\Gamma}_{\beta \gamma}^{\alpha} v^{\beta} \mathrm{d} u^{\gamma},
$$

it has been shown in [2]

$$
\begin{equation*}
\check{\Gamma}_{\beta \gamma}^{\alpha}=p_{i}^{\alpha}\left(p_{\beta \gamma}^{i}+\Gamma_{j k}^{i} p_{\beta}^{j} p_{\gamma}^{k}\right) . \tag{r.9}
\end{equation*}
$$

Yoshida ([3]) defines for the projection parameters $p_{\alpha}^{i}$,

$$
\begin{equation*}
\stackrel{\circ}{\mathrm{H}}_{\beta \alpha}^{i} \stackrel{\text { def }}{=} \mathrm{D}_{\beta} p_{\alpha}^{i} \stackrel{\text { def }}{=} p_{\alpha \beta}^{i}+\Gamma_{j k}^{i} p_{\beta}^{j} p_{\alpha}^{k}-\check{\Gamma}_{\alpha \beta}^{\gamma} p_{\gamma}^{i} . \tag{I.IO}
\end{equation*}
$$

Using (I.9) and normal vector ${\underset{\mu}{i}}_{n^{i}}$ of $\mathrm{K} n$, (I.IO) can be written as

$$
\begin{equation*}
\stackrel{\circ}{\mathrm{H}}_{\beta \alpha}^{i}=\mathrm{H}_{\beta \alpha}^{\mu} n_{\mu}^{i} \tag{I.II}
\end{equation*}
$$

from which it follows

$$
\begin{equation*}
\mathrm{H}_{\beta \alpha}^{\mu}=\mathrm{G}^{\nu \mu} \mathrm{G}_{i j}{\underset{\nu}{ } n^{2} \stackrel{\circ}{\mathrm{H}}_{\beta \alpha}^{j}=\mathrm{G}^{\mu \nu} n_{\nu} \stackrel{\circ}{\mathrm{H}}_{\beta \alpha}^{i}, ~}_{\text {, }} \tag{I.12}
\end{equation*}
$$

where $G^{\nu \mu}$ has the same meaning as in [2].

## 2. DIFFERENCE BETWEEN INDUCED AND INTRINSIC CONNECTIONS

The connection coefficients of the imbedding space $\mathrm{K} n$ are denoted by $\Gamma_{j k}^{i}$ and the induced connection coefficients of subspace $K m$ have been given by (I.9). With the help of (I.5) and (I.9) we can write,

$$
\begin{equation*}
\mathrm{G}_{\alpha \delta} \check{\Gamma}_{\beta \gamma}^{\alpha}=\mathrm{G}_{i j} p_{\delta}^{j}\left(p_{\beta \gamma}^{i}+\Gamma_{j k}^{i} p_{\beta}^{j} p_{\gamma}^{k}\right) \tag{2.I}
\end{equation*}
$$

The most significant motivation for the definition (I.9) is in the fact that it leads directly to the fundamentally important induced normal curvature vector $\stackrel{\circ}{\mathrm{H}}_{\beta \alpha}^{i}$, given by (I.IO), which derives its name from the circumstance that it is normal to Km , i.e.

$$
\begin{equation*}
\mathrm{G}_{i j} p_{\delta}^{j} \stackrel{\circ}{\mathrm{H}}_{\beta \alpha}^{i}=\mathrm{o} \tag{2.2}
\end{equation*}
$$

as is immediately evident by multiplication of (I.IO) by $G_{i j} p_{\delta}^{j}$ and subsequent application of (I.4) and (2.I).

The intrinsic connection coefficients $\Gamma_{\beta \gamma}^{\alpha} \stackrel{\text { def }}{=} \frac{\partial^{2} \Gamma^{\alpha}}{\partial u^{\beta} \partial u^{\gamma}}$ have been defined as ([2])

$$
\begin{equation*}
\Gamma_{\beta \gamma}^{\alpha}=\check{\Gamma}_{\beta \gamma}^{\alpha}+\Gamma_{(\beta)}^{* i} p_{i(\gamma)}^{\alpha}+\Gamma_{(\gamma)}^{* i} p_{i(\beta)}^{\alpha}+\Gamma^{* i} p_{i(\beta)(\gamma)}^{\alpha} \tag{2.3}
\end{equation*}
$$

where

$$
\Gamma^{* i} \stackrel{\text { def }}{=} \Gamma^{i}+\frac{\mathrm{I}}{2} p_{\alpha \beta}^{i} u^{\alpha} u^{\beta}
$$

In analogy with (I.IO) we construct the intrinsic curvature vector

$$
\begin{equation*}
\stackrel{\circ}{\mathrm{H}_{\beta \alpha}^{i}} \stackrel{\text { def }}{=} p_{\alpha \beta}^{i}+\Gamma_{j k}^{i} p_{\beta}^{j} p_{\alpha}^{k}-\Gamma_{\alpha \beta}^{\gamma} p_{\gamma}^{i} \tag{2.4}
\end{equation*}
$$

Let us define the form,

$$
\begin{equation*}
\Lambda_{\beta \varepsilon \gamma} \stackrel{\text { def }}{=} \Gamma_{\beta \varepsilon \gamma}-\check{\Gamma}_{\beta \varepsilon \gamma}=G_{\alpha \varepsilon}\left(\Gamma_{\beta \gamma}^{\alpha}-\check{\Gamma}_{\beta \gamma}^{\alpha}\right) . \tag{2.5}
\end{equation*}
$$

This equation and (2.3) yield

$$
\begin{equation*}
\Lambda_{\beta \gamma}^{\alpha}=p_{i(\gamma)}^{\alpha} \Gamma_{(\beta)}^{*_{i}}+p_{i(\beta)}^{\alpha} \Gamma_{(\gamma)}^{* i}+\Gamma^{*_{i}} p_{i(\beta)(\gamma)}^{\alpha} \tag{2.6}
\end{equation*}
$$

In [2] $\Gamma^{\alpha}$ has been written in the form,

$$
2 \Gamma^{\alpha}=\left[2 \Gamma^{i}+p_{\beta \gamma}^{i} u^{\beta} u^{\gamma}\right] p_{i}^{\alpha}
$$

which gives

$$
\begin{equation*}
p_{\alpha}^{i} \Gamma^{\alpha}=\Gamma^{i}+\frac{1}{2} p_{\beta \gamma}^{i} u^{\beta} \dot{u}^{\gamma}=\Gamma^{* i} . \tag{2.7}
\end{equation*}
$$

If we use (2.7), then the equation (2.6) can be expressed as

$$
\begin{align*}
\Lambda_{\beta \gamma}^{\alpha} & =\Gamma_{(\beta)(\gamma)}^{\alpha}-\Gamma_{(\beta)(\gamma)}^{* i} p_{i}^{\alpha}  \tag{2.8}\\
& =\Gamma_{(\beta)(\gamma)}^{\alpha}-\left(p_{\alpha}^{i} \Gamma^{\alpha}\right)_{(\beta)(\gamma)} p_{i}^{\alpha},
\end{align*}
$$

since $p_{\alpha}^{i} \Gamma^{\alpha}=\Gamma^{*_{i}}$, the above equation becomes

$$
\begin{equation*}
\Lambda_{\beta_{\gamma}}^{\alpha}=\Gamma_{\beta \gamma}^{\alpha}-\Gamma_{\beta_{\gamma}}^{*_{i}} p_{i}^{\alpha} . \tag{2.9}
\end{equation*}
$$

If $\mathrm{A}_{i(j)(k)}=0$ and $m, n$ are both even, then it has been proved in [2] that the intrinsic and induced connection parameters coincide, i.e.

$$
\begin{equation*}
\Lambda_{\beta_{\gamma}}^{\alpha}=\mathrm{o} . \tag{2.10}
\end{equation*}
$$

Now substituting (1.10) from (2.4) and using (2.5), we get

$$
\begin{equation*}
\stackrel{\circ}{\mathrm{H}}_{\beta \alpha}^{i}=\stackrel{\circ}{\mathrm{H}}_{\beta \alpha}^{i}-p_{\delta}^{i} \Lambda_{\beta \alpha}^{\delta} . \tag{2.1I}
\end{equation*}
$$

Hence, we get
THEOREM (2.1). The intrinsic curvature vector differs from induced normal curvature vector merely by a tangential component.

Further the equation (2.1I) proves:
Corollary (2.1). The vector $\stackrel{\circ}{4}_{\beta \alpha}^{i}$ is not, in general, normal to the subspace.

If in analogy to equation (I.12) we define

$$
\begin{equation*}
\stackrel{*}{\mathrm{H}}_{\beta \alpha}^{\mu}=\stackrel{\stackrel{i}{\mathrm{H}}}{\beta \alpha}_{i}^{\mathrm{G}_{i j}}{\underset{\nu}{n}}^{j} \mathrm{G}^{\mu \nu} \tag{2.12}
\end{equation*}
$$

then in view of the equations (2.11) and (2.12) we obtain,

$$
\begin{equation*}
\stackrel{*}{H}_{\beta \alpha}^{\mu}=\mathrm{H}_{\beta \alpha}^{\mu} \tag{2.13}
\end{equation*}
$$

Therefore,
Theorem (2.2). The same second fundamental tensor can be used in both the induced and intrinsic theories.

## 3. Derivatives of a vector field

For the curve $\mathrm{C}: x^{i}=x^{i}(t)$ [or $\left.u^{\alpha}=u^{\alpha}(t)\right]$ of the subspace $\mathrm{K} m$, the unit tangent vectors $\dot{x}^{i}=\frac{\mathrm{d} x^{i}}{\mathrm{~d} t}$ and $u^{\alpha}=\frac{\mathrm{d} u^{\alpha}}{\mathrm{d} t}$ are related by

$$
\dot{x}^{i}=p_{\alpha}^{i} u^{\alpha} .
$$

Let

$$
\begin{equation*}
\mathrm{X}^{i}(t)=p_{\alpha}^{i} \mathrm{U}^{\alpha}(t) \tag{3.1}
\end{equation*}
$$

be a vector field tangent to $\mathrm{K} m$. It is supposed that $\mathrm{X}^{i}$ is a differentiable function of $\left(x^{j}, x^{j}\right)$. We shall now obtain a relation between the covariant derivative $\delta \mathrm{X}^{i} / \delta t$ (with respect to the connection of the imbedding space $\mathrm{K} n$ ) and the intrinsic covariant derivative $\delta U^{\alpha} / \delta t$ (with respect to the intrinsic connection of $\mathrm{K} m$ ). The latter is defined by

$$
\begin{equation*}
\frac{\delta \mathrm{U}^{\varepsilon}}{\delta t}=\frac{\mathrm{d} \mathrm{U}^{\varepsilon}}{\mathrm{d} t}+\Gamma_{\alpha \beta}^{\varepsilon} \mathrm{U}^{\alpha} \varkappa^{\beta} . \tag{3.2}
\end{equation*}
$$

The equation (3.1), when differentiated with respect to $t$ along the curve C , yields,

$$
\begin{equation*}
\frac{\mathrm{dX}}{\mathrm{~d} t}=p_{\alpha \beta}^{i} \mathrm{U}^{\alpha} u^{\beta}+p_{\varepsilon}^{i} \frac{\mathrm{~d} U^{\varepsilon}}{\mathrm{d} t} . \tag{3.3}
\end{equation*}
$$

Also, due to (1.7) and (3.1), we have

$$
\begin{equation*}
\frac{\delta \mathrm{X}^{i}}{\delta t}=\frac{\mathrm{dX}}{\mathrm{i} t}+\Gamma_{j k}^{i} \mathrm{U}^{\alpha} p_{\alpha}^{j} u^{\beta} p_{\beta}^{k} . \tag{3.4}
\end{equation*}
$$

The elimination of $p_{\alpha \beta}^{i}$ from (3.3) and (2.4) gives

$$
\frac{\mathrm{dX}}{\mathrm{~d} t}=\left[\stackrel{\circ}{\mathrm{H}}_{\beta \alpha}^{i}-\Gamma_{j k}^{i} p_{\beta}^{j} p_{\alpha}^{k}+\Gamma_{\alpha \beta}^{\gamma} p_{\gamma}^{i}\right] \mathrm{U}^{\alpha} i^{\beta}+p_{\varepsilon}^{i} \frac{\mathrm{dU}}{\mathrm{~d} t} .
$$

After simplifying this equation with the help of (3.2) and (3.4), we get

$$
\begin{equation*}
\frac{\delta \mathrm{X}^{i}}{\delta t}=\stackrel{\left.\stackrel{\circ}{\mathrm{H}_{\beta \alpha}^{i}} \mathrm{U}^{\alpha} \ddot{u}^{\beta}+p_{\varepsilon}^{i}\left(\frac{\delta \mathrm{U}^{\varepsilon}}{\delta t}\right), ~()^{2}\right)}{ } \tag{3.5}
\end{equation*}
$$

which in view of (2.1I) and (I.II) takes the form,

$$
\begin{equation*}
\frac{\delta \mathrm{X}^{i}}{\delta t}=\mathrm{H}_{\beta \alpha}^{\mu} n_{\mu}^{i} \mathrm{U}^{\alpha} u^{\beta}+p_{\varepsilon}^{i}\left(\frac{\delta \mathrm{U}^{\varepsilon}}{\delta t}-\Lambda_{\beta \alpha}^{\varepsilon} \mathrm{U}^{\alpha} u^{\beta}\right) . \tag{3.6}
\end{equation*}
$$

This is the required result.
The following theorems are immediate from equation (3.6):
THEOREM (3.1). If the vector field $\mathrm{X}^{i}$ tangential to $\mathrm{K} m$ is parallel along a curve (of $\mathrm{K} m$ ) with respect to $\mathrm{K} n$, it is not necessary that the vector field $\mathrm{U}^{\alpha}$ is parallel along the curve with respect to intrinsic connection of $\mathrm{K} m$. Under these circumstances, we have

$$
\begin{equation*}
\frac{\delta U^{\varepsilon}}{\delta t}=\Lambda_{\beta \alpha}^{\varepsilon} \mathrm{U}^{\alpha} \ddot{u}^{\beta} \tag{3.7}
\end{equation*}
$$

THEOREM (3.2). If the induced and intrinsic connection parameters coincide then the parallelism (along a curve of $\mathrm{K} m$ ) of the vector field $\mathrm{X}^{i}$ in $\mathrm{K} n$ implies the parallelism along the curve of the vector field $\mathrm{U}^{\alpha}$ in $\mathrm{K} m$ and vice versa.

## 4. Induced derivatives

In analogy to article 3, we shall derive an expression involving the covariant derivative $\delta \mathrm{X}^{i} / \delta t$ of a vector field $\mathrm{X}^{i}$ and induced covariant derivative $\check{\delta} \mathrm{U}^{\alpha} / \check{\delta} t$. The latter is given by

$$
\begin{equation*}
\frac{\check{\delta} U^{\varepsilon}}{\check{\delta} t}=\frac{\mathrm{d} U^{\varepsilon}}{\mathrm{d} t}+\check{\Gamma}_{\alpha \beta}^{\varepsilon} U^{\alpha} \ddot{u}^{\beta} . \tag{4.I}
\end{equation*}
$$

On eliminating $p_{\alpha \beta}^{i}$ from (1.10) and (3.3), we get

$$
\frac{\mathrm{dX}}{\mathrm{~d} t}=\left[\stackrel{\circ}{\mathrm{H}}_{\beta \alpha}^{i}-\Gamma_{j k}^{i} p_{\beta}^{j} p_{\alpha}^{k}+\check{\Gamma}_{\alpha \beta}^{\gamma} p_{\gamma}^{i}\right] \mathrm{U}^{\alpha} u^{\beta}+p_{\varepsilon}^{i} \frac{\mathrm{dU}}{\mathrm{~d} t} .
$$

Taking the help of equations (3.4) and (4.1) this equation becomes,

$$
\begin{equation*}
\frac{\delta \mathrm{X}^{i}}{\delta t}=\stackrel{\circ}{\mathrm{H}}_{\beta \alpha}^{i} \mathrm{U}^{\alpha} \hat{u}^{\beta}+p_{\varepsilon}^{i} \frac{\check{\delta} U^{\Sigma}}{\check{\delta} t} . \tag{4.2}
\end{equation*}
$$

Using (I.II), we get

$$
\begin{equation*}
\frac{\delta \mathrm{X}^{i}}{\delta t}=n_{\mu}^{i} \mathrm{H}_{\beta \alpha}^{\mu} \mathrm{U}^{\alpha} u^{\beta}+p_{\varepsilon}^{i} \frac{\check{\delta} U^{\varepsilon}}{\check{\delta} t} . \tag{4.3}
\end{equation*}
$$

This yields the following:
Theorem (4.1). The necessary and sufficient condition that a vector field of the subspace be parallel along a curve in $\mathrm{K} n$ is that it is parallel along the curve with respect to induced connection of $\mathrm{K} m$.

Now we suppose that $\mathrm{U}^{\alpha}=\ddot{u}^{\alpha}$. On the assumption that $\Gamma^{i}$ are homogeneous of degree two with respect to the $x$, it has been shown (Yoshida [2]),

$$
\begin{equation*}
\Gamma_{\beta \alpha}^{\varepsilon} u^{\beta} u^{\alpha}=\check{\Gamma}_{\beta \alpha}^{\varepsilon} u^{\beta} \dot{u}^{\alpha} . \tag{4.4}
\end{equation*}
$$

Hence, by (2.5) we get

$$
\begin{equation*}
\Lambda_{\beta \alpha}^{\varepsilon} \tilde{u}^{\beta} u^{\alpha}=\mathrm{o} . \tag{4.5}
\end{equation*}
$$

Thus, Theorem (3.I) takes the form:
Theorem (4.2). The necessary and sufficient condition that a curve of the subspace be auto parallel in $\mathrm{K} n$, is that, it is auto parallel in $\mathrm{K} m$ with respect to the intrinsic connection parameter.
