RIASSUNTO. — Si danno condizioni sufficienti perché tutte le traiettorie oscillatorie del sistema differenziale \( x'(t) = \dot{p}(t)y(t), \quad y'(t) = f(t, x(g(t))) \) tendano a zero quando \( t \to \infty \).

1. INTRODUCTION

This paper is concerned with systems of differential equations of the form

\[
\begin{align*}
\dot{x}(t) &= \dot{p}(t)y(t), \\
\dot{y}(t) &= f(t, x(g(t))),
\end{align*}
\]

where \( \dot{p}(t) \) and \( g(t) \) are continuous on \([a, \infty)\) and \( f(t, x) \) is continuous on \([a, \infty) \times (-\infty, \infty)\). In addition, it will be assumed throughout that the following conditions hold:

(a) \( \dot{p}(t) \geq 0 \), with \( \dot{p}(t) \) not identically zero on any infinite subinterval of \([a, \infty)\);

(b) \( g(t) \leq t \), \( \lim_{t \to \infty} g(t) = \infty \);

(c) \( |f(t, x)| \leq \omega(t, |x|) \) on \([a, \infty) \times (-\infty, \infty)\), where \( \omega(t, r) \) is a continuous function on \([a, \infty) \times [0, \infty)\) which is nondecreasing in \( r \) and such that \( \omega(t, r)r \) is nonincreasing in \( r \).

If in particular \( \dot{p}(t) > 0 \) on \([a, \infty)\), then the system (A) is equivalent to the second order scalar equation

\[
\left( \frac{1}{\dot{p}(t)}x'(t) \right)' = f(t, x(g(t))).
\]

In what follows our attention will be restricted to solutions \( \{x(t), y(t)\} \) of (A) which exist on some ray \([T, \infty)\) and satisfy

\[
\sup \{|x(t)| + |y(t)| : t \geq T'\} > 0 \quad \text{for any } T' \geq T.
\]

Such a solution is termed oscillatory if each of its components is oscillatory in the usual sense, that is, if it has arbitrarily large zeros.

Recently, conditions for all solutions of (A) to be oscillatory have been found by Vareh, Gritsai and Ševelo [4] and by the present authors [1].

(*) Nella seduta del 12 marzo 1977.
The objective of this paper is to study the asymptotic behavior of oscillatory solutions of (A). Sufficient conditions will be given which guarantee that all oscillatory solutions \( \{x(t), y(t)\} \) of (A) vanish asymptotically in the sense that \( x(t) \to 0 \) and \( y(t) \to 0 \) as \( t \to \infty \). When specialized to the scalar equation (B), our results include those of Singh [3] and Kusano and Onose [2].

2. The case \( \int_{a}^{\infty} p(t) \, dt < \infty \)

We begin by examining the differential system (A) in which \( p(t) \) satisfies the condition

\[
\int_{a}^{\infty} p(t) \, dt < \infty.
\]

The following notation will be used throughout this section:

\[
\pi(t) = \int_{t}^{\infty} p(s) \, ds.
\]

**Lemma 1.** Assume that

\[
\int_{a}^{\infty} \pi(t) \omega(t, 1) \, dt < \infty.
\]

If \( \{x(t), y(t)\} \) is a solution of (A) defined on \([T, \infty)\), then

\[
x(t) = O(1) \quad \text{as} \quad t \to \infty \quad \text{and} \quad p(t) y(t) \in L^1 [T, \infty).
\]

**Proof.** Let \( t_0 \geq T \) be such that \( \tau_0 = \inf \{g(t) : t \geq t_0 \} \geq T \). By combining

\[
|x(t)| \leq |x(t_0)| + \int_{t_0}^{t} p(s) \, y(s) \, ds,
\]

\[
|y(t)| \leq |y(t_0)| + \int_{t_0}^{t} \omega(s, |x(g(s))|) \, ds,
\]

which follow from (A), we have

\[
|x(t)| \leq |x(t_0)| + \pi(t_0) |y(t_0)| + \int_{t_0}^{t} p(s) \int_{t_0}^{s} \omega(\sigma, |x(g(\sigma))|) \, d\sigma \, ds
\leq a + \int_{t_0}^{t} \pi(s) \omega(s, |x(g(s))|) \, ds, \quad t \geq t_0,
\]
where \( a \) is a positive constant. To show that \( x(t) = O(1) \) as \( t \to \infty \) consider the function

\[
u(t) = \max \{1, \sup_{0 \leq s \leq t} |x(s)|\}.
\]

We may suppose that \( |x(t)| > 1 \) for some \( t > t_0 \). Then, \( t_1 > t_0 \) can be chosen so that

\[
u(t) = \sup_{t_1 \leq s \leq t} |x(s)| \quad \text{for} \quad t \geq t_1.
\]

Take \( t_2 > t_1 \) so large that \( g(t) \leq t_1 \) for \( t \geq t_2 \) and

\[
\int_{t_2}^{\infty} \pi(t) \omega(t,1) \, dt \leq \frac{1}{2}.
\]

Using (4), (5) and the condition (c), we obtain

\[
u(t) \leq a + \int_{t_0}^{t} \pi(s) \omega(s, u(g(s))) \, ds
\]

\[
= b + \int_{t_2}^{t} \pi(s) \omega(s, u(g(s))) \, ds
\]

\[
\leq b + \nu(t) \int_{t_2}^{t} \pi(s) \omega(s,1) \, ds, \quad t \geq t_2,
\]

where \( b \) is a positive constant. In view of (6) this implies \( \nu(t) \leq 2b \) for \( t \geq t_2 \), and so \( x(t) = O(1) \) as \( t \to \infty \). Multiplying both sides of (3) by \( p(t) \), integrating it from \( t_0 \) to \( \infty \) and noting that \( |x(t)| \leq c, t \geq t_0 \), for some \( c \geq 1 \), we see that

\[
\int_{t_0}^{\infty} p(t) |y(t)| \, dt \leq \pi(t_0) |y(t_0)| + c \int_{t_0}^{\infty} \pi(t) \omega(t,1) \, dt,
\]

which shows \( p(t) y(t) \in L^1[T, \infty) \).

The main result of this section is the following

**Theorem 1.** Let \( \{x(t), y(t)\} \) be an oscillatory solution of (A).

(i) Suppose that (1) holds. Then, \( x(t) = o(1) \) as \( t \to \infty \).

(ii) Suppose that

\[
\int_{t_0}^{\infty} \omega(t, \pi(g(t))) \, dt < \infty.
\]

Then, \( x(t) = o(1) \) and \( y(t) = o(1) \) as \( t \to \infty \).
Proof. Let \( \{x(t), y(t)\} \) be an oscillatory solution of (A) defined on \([T, \infty)\). Take \( t_0 \geq T \) so that \( \tau_0 = \inf \{g(t) : t \geq t_0 \} \geq T \).

(i) Suppose (1) holds. Then, \( p(t)y(t) \in L^1[T, \infty) \) by Lemma 1, and so from the first equation of (A) we have

\[
x(t) = x(t_0) + \int_{t_0}^{t} p(s)y(s)\,ds
\]

for \( t \geq t_0 \). Since \( x(t) \) is oscillatory by hypothesis, we must have

\[
x(t_0) + \int_{t_0}^{\infty} p(s)y(s)\,ds = 0,
\]

and this yields

\[
x(t) = -\int_{t}^{\infty} p(s)y(s)\,ds, \quad t \geq t_0.
\]

That \( x(t) = o(1) \) as \( t \to \infty \) is a consequence of (9).

(ii) Suppose (7) holds. Since (7) implies (1), it follows that \( x(t) = o(1) \) as \( t \to \infty \). Actually, it can be shown that \( x(t) = O(\pi(t)) \) as \( t \to \infty \). Substituting (3) in (5), we find

\[
|x(t)| \leq \pi(t)|y(t_0)| + \int_{t_0}^{t} p(s)\int_{s}^{\infty} \omega(\sigma, |x(g(\sigma))|)\,d\sigma\,ds
\]

\[
= \pi(t)|y(t_0)| + \pi(t)\int_{t_0}^{t} \omega(s, |x(g(s))|)\,ds
\]

\[
+ \int_{t}^{\infty} \pi(s)\omega(s, |x(g(s))|)\,ds, \quad t \geq t_0,
\]

which yields

\[
|x(t)|/\pi(t) \leq |y(t_0)| + \int_{t_0}^{t} \omega(s, |x(g(s))|)\,ds
\]

\[
+ \pi(t)^{-1}\int_{t}^{\infty} \pi(s)\omega(s, |x(g(s))|)\,ds, \quad t \geq t_0.
\]
Suppose to the contrary that \(|x(t)|/\pi(t)| is unbounded and let

\[ v(t) = \max \{1, \sup_{t_0 \leq s \leq t} |x(s)|/\pi(s)| \}. \]

There exist \(t_1, t_2, t_3\) such that \(t_0 < t_1 < t_2 < t_3\),

\[ (11) \quad v(t) = \sup_{t_1 \leq s \leq t} |x(s)|/\pi(s)|, \quad t \geq t_1, \]

\[ (12) \quad \int_{t_2}^{\infty} \omega(s, \pi(g(s))) \, ds \leq \frac{1}{4}, \]

and

\[ (13) \quad |y(t_0)| + v(t_2) \int_{t_0}^{t_2} \omega(s, \pi(g(s))) \, ds \leq \frac{1}{4} v(t_2). \]

Observing that the right hand side of (10) is an increasing function of \(t\) and using (11)-(13), we see that for \(t \geq t_3\)

\[ v(t) \leq |y(t_0)| + v(t_2) \int_{t_0}^{t_2} \omega(s, \pi(g(s))) \, ds + v(t) \int_{t_2}^{\infty} \omega(s, \pi(g(s))) \, ds \]

\[ + \pi(t)^{-1} \int_{t}^{\infty} \pi(s) v(s) \omega(s, \pi(g(s))) \, ds \]

\[ \leq \frac{1}{2} v(t) + \pi(t)^{-1} \int_{t}^{\infty} \pi(s) v(s) \omega(s, \pi(g(s))) \, ds. \]

Consequently,

\[ \pi(t) v(t) \leq 2 \int_{t}^{\infty} \pi(s) v(s) \omega(s, \pi(g(s))) \, ds, \quad t \geq t_3, \]

from which it follows readily that

\[ \sup_{s \geq t} [\pi(s) v(s)] \leq 2 \sup_{s \geq t} [\pi(s) v(s)] \int_{t}^{\infty} \omega(s, \pi(g(s))) \, ds, \quad t \geq t_3, \]

or

\[ 1 \leq 2 \int_{t}^{\infty} \omega(s, \pi(g(s))) \, ds, \quad t \geq t_3. \]

This contradiction proves that \(x(t) = O(\pi(t))\) as \(t \to \infty\).
In view of this property of \( x(t) \) and (7) we see that \( f(t, x(g(t))) \in L^1[t_0, \infty) \). Hence, from the second equation of (A) we get

\[
y(t) = y(t_0) + \int_{t_0}^{t} f(s, x(g(s))) \, ds
\]

\[
= y(t_0) + \int_{t_0}^{\infty} f(s, x(g(s))) \, ds - \int_{t}^{\infty} f(s, x(g(s))) \, ds.
\]

Using the fact that \( y(t) \) is oscillatory, we have

\[
y(t_0) + \int_{t_0}^{\infty} f(s, x(g(s))) \, ds = 0,
\]

and thus we conclude that

\[
y(t) = -\int_{t}^{\infty} f(s, x(g(s))) \, ds, \quad t \geq t_0.
\]

Therefore, \( y(t) = o(1) \) as \( t \to \infty \). This completes the proof of Theorem 1.

**Example 1.** Consider the system

\[
\begin{cases}
x' = t^{-3/2} (1 + \sin (\ln t)) \, y,

\frac{d}{dt} y' = -\frac{3}{2} t^{-1/2} |x|^{1/2} \text{sgn} x + 2 t^{-3/2} (1 - \cos (\ln t)).
\end{cases}
\]

Here we can take

\[
\pi(t) = t^{-1/2} \quad \text{and} \quad \omega(t, r) = \frac{3}{2} t^{-1/2} + 4 t^{-3/2}.
\]

It is easily verified that the condition (7) is satisfied, so that by Theorem 1 (ii) all oscillatory solutions of (16) vanish asymptotically. Actually, (16) has an oscillatory solution

\[
\begin{cases}
x(t) = t^{-1} (1 + \sin (\ln t))^2,

y(t) = t^{-1/2} (2 \cos (\ln t) - \sin (\ln t) - 1)
\end{cases}
\]

with this asymptotic property.
3. THE CASE \( \int_{a}^{\infty} \rho(t) \, dt = \infty \)

We now turn to the differential system (A) in which \( \rho(t) \) is subject to the condition

\[
\int_{a}^{\infty} \rho(t) \, dt = \infty.
\]

The following notation will be used:

\[
P(t) = \int_{a}^{t} \rho(s) \, ds.
\]

**Lemma 2.** Assume that

\[
\int_{0}^{\infty} \omega(t, P(g(t))) \, dt < \infty.
\]

Then, every solution \( \{x(t), y(t)\} \) of (A) has the property:

\[
x(t) = O(P(t)) \quad \text{and} \quad y(t) = O(1) \quad \text{as} \quad t \to \infty.
\]

**Proof.** Let \( \{x(t), y(t)\} \) be defined on \([T, \infty)\) and let \( t_0 \geq T \) be such that \( \tau_0 = \inf \{g : t \geq t_0 \} \geq T. \) From (2) and (3) we obtain

\[
|x(t)| \leq |x(t_0)| + P(t) |y(t_0)| + P(t) \int_{t_0}^{t} \omega(s, |x(g(s))|) \, ds,
\]

for \( t \geq t_0, \) which gives

\[
|x(t)|P(t) \leq A + \int_{t_0}^{t} \omega(s, |x(g(s))|) \, ds, \quad t \geq t_0,
\]

where \( A \) is a positive constant. Defining

\[
u(t) = \max \{1, \sup_{0 \leq r \leq \tau \leq t} [x(r)|P(r)] \}
\]

and applying the same type of argument that was used to prove Lemma 1, we easily conclude from (18) that \( u(t) \) is bounded, that is, \( x(t) = O(P(t)) \) as \( t \to \infty. \) There is a constant \( c \geq 1 \) such that \( |x(t)| \leq cP(t) \) for \( t \geq T. \)
Using this inequality in (3), we have

\[ |y(t)| \leq |y(t_0)| + \epsilon \int_{t_0}^{t} \omega(s, P(g(s))) \, ds, \quad t \geq t_0, \]

which shows that \( y(t) = O(1) \) as \( t \to \infty \).

We now state and prove the main result of this section.

**Theorem 2.** Let \( \{x(t), y(t)\} \) be an oscillatory solution of (A).

(i) Suppose that (17) holds. Then, \( y(t) = o(1) \) as \( t \to \infty \).

(ii) Suppose that

\[ \int_{t}^{\infty} P(t) \omega(t, 1) \, dt < \infty. \]

Then, \( x(t) = o(1) \) and \( y(t) = o(1) \) as \( t \to \infty \).

**Proof.** Let \( \{x(t), y(t)\} \) be an oscillatory solution of (A) defined on \( [T, \infty) \). Choose \( t_0 \geq T \) so that \( \tau_0 = \inf \{g(t) : t \geq t_0 \} \leq T. \)

(i) Suppose (17) holds. By Lemma 2, \( x(t) = O(P(t)) \) as \( t \to \infty \), so that \( f(t, x(g(t))) \in L^1[t_0, \infty] \). Integrating the second equation of (A) and noting that (14) holds, we conclude that \( y(t) \) admits the expression (15), and hence \( y(t) = o(1) \) as \( t \to \infty \).

(ii) Suppose (19) holds. Since (19) is stronger than (17), we see that \( y(t) = o(1) \) as \( t \to \infty \). Substituting (15) in (2), we have

\[ |x(t)| \leq |x(t_0)| + \int_{t_0}^{t} P(s) \omega(s, |x(g(s))|) \, ds + P(t) \int_{s}^{\infty} \omega(s, |x(g(s))|) \, ds \]

for \( t \geq t_0 \). On the basis of (20) we shall show that \( x(t) = O(1) \) as \( t \to \infty \). Suppose the contrary. Then, defining

\[ v(t) = \max \{1, \sup_{t_0 \leq s \leq t} |x(s)|\}, \]

we can find \( t_1, t_2, t_3 \) such that \( t_0 < t_1 < t_2 < t_3 \), and

\[ v(t) = \sup_{t_1 \leq s \leq t} |x(s)|, \quad t \geq t_1, \]

\[ \int_{t_2}^{\infty} P(s) \omega(s, 1) \, ds \leq \frac{1}{4}, \]

\[ |x(t_0)| + v(t_0) \int_{t_0}^{t_2} P(s) \omega(s, 1) \, ds \leq \frac{1}{4} v(t_0). \]
It is a matter of easy computation to derive from (20)-(23) the following inequality

\[ v(t) \leq 2 P(t) \int_{t}^{\infty} v(s) \omega(s, 1) \, ds \quad \text{for} \quad t \geq t_3. \]

From this it follows that

\[ \sup_{s \geq d}[v(s)/P(s)] \leq 2 \sup_{s \geq d}[v(s)/P(s)] \int_{t}^{\infty} P(s) \omega(s, 1) \, ds, \quad t \geq t_3, \]

or

\[ 1 \leq 2 \int_{t}^{\infty} P(s) \omega(s, 1) \, ds, \quad t \geq t_3, \]

which is a contradiction. Therefore, we must have \( x(t) = O(1) \) as \( t \to \infty \).

Let \( c \geq 1 \) be a constant such that \( |x(t)| \leq c \) for \( t \geq T \). Using (15) and this inequality, we have

\[ \int_{t_0}^{\infty} \frac{1}{P(s)} y(s) \, ds \leq \int_{t_0}^{\infty} \frac{1}{P(s)} \omega(s, 1) |x(t)| \, ds \]

\[ \leq c \int_{t_0}^{\infty} \frac{1}{P(s)} \omega(s, 1) \, ds, \]

and thus \( p(t) y(t) \in L^1[t_0, \infty) \). If we integrate the first equation of (A) and notice that (8) holds on account of the oscillation of \( x(t) \), then we conclude that \( x(t) \) admits the expression (9), and therefore \( x(t) = o(1) \) as \( t \to \infty \). The proof of Theorem 2 is thus complete.

**Example 2.** Consider the system

\[
\begin{align*}
x'(t) &= 3 (1 + \sin (\ln t))^\alpha y(t), \\
y'(t) &= t^{-\beta} [x^{1/2} (t^\beta) \left( 1 + \cos (\ln t) + \sin (\ln t) + \sin (\beta \ln t) \right)],
\end{align*}
\]

where \( \alpha \) and \( \beta \) are positive constants with \( \beta \leq 1 \). Here we can take

\[ P(t) = t \quad \text{and} \quad \omega(t, r) = t^{-\alpha}(r^{1/2} + 4). \]

If \( \alpha > 2 \), then (19) is satisfied, so that by Theorem 2—(ii) every oscillatory solution of (24) vanishes asymptotically as \( t \to \infty \). If \( \alpha = 2 \), then (19) is violated, and (24) possesses an oscillatory solution

\[
\begin{align*}
x(t) &= (1 + \sin (\ln t))^3, \\
y(t) &= t^{-1} \cos (\ln t),
\end{align*}
\]

not vanishing asymptotically as \( t \to \infty \). We observe that the condition (17) is satisfied and the solution (25) justifies the assertion of Theorem 2—(i).
