Algebra. - Subproducts defined by means of subdirect products. Nota di Frans Loonstra, presentata ${ }^{(*)}$ dal Socio G. Zappa.

Riassunto. - Si supponga che l'anello $\mathbf{R}$ ammetta una decomposizione come prodotto subdiretto $R=\underset{\alpha \in A}{\times} \mathbf{R}_{\alpha}$ di anelli $\mathrm{R}_{\alpha} \neq 0$, tali che per $\mathrm{S}_{\alpha}=\mathbf{R} \cap \mathbf{R}_{\alpha}$ si abbia $\mathrm{Ann}_{\mathrm{R}_{\alpha}} \mathrm{S}_{\alpha}=0(\forall \alpha \in \mathrm{~A})$, e sia $\mathrm{S}=\underset{\alpha \in \mathrm{A}}{\oplus} \mathrm{S}_{\alpha}$. Si scelga un R -modulo (destro) M che sia libero da torsione rispetto ad $S$, cioè $\mathrm{Ann}_{\mathrm{M}} \mathrm{S}=0$; allora M può essere rappresentato come prodotto subdiretto irridondante $\mathrm{M} \cong \underset{\alpha \in \mathrm{A}}{\underset{\sim}{x}} \mathrm{M}_{\alpha}$ degli $\mathrm{R}_{\alpha}$-moduli $\mathrm{M}_{\alpha}$ liberi da torsione rispetto ad $\mathrm{S}_{\alpha}$. Si fa uno studio di un subprodotto generale di una classe C di R -moduli $\left.\mathrm{M}^{(i)}{ }_{(i \in \mathrm{I}}\right)$, dove C è determinato per mezzo di epimorfismi e relazioni.

## 1. Introduction

We assume that the (associative) ring $R$ (with $1_{R}=1$ ) admits a decomposition as a subdirect product

$$
\begin{equation*}
\mathrm{R}=\underset{\alpha \in \mathrm{A}}{\times} \mathrm{R}_{\alpha} \tag{1}
\end{equation*}
$$

of rings $R_{\alpha} \neq 0(\alpha \in A)$ such that $S_{\alpha}=R \cap R_{\alpha}$ satisfies the condition

$$
\begin{equation*}
\mathrm{Ann}_{\mathrm{R}_{\alpha}} \mathrm{S}_{\alpha}=\left\{r_{\alpha} \in \mathrm{R}_{\alpha} \mid r_{\alpha} \mathrm{S}_{\alpha}=0\right\}=0 \quad(\forall a \in \mathrm{~A}) \tag{2}
\end{equation*}
$$

In particular, $S_{\alpha} \neq 0(\forall a \in A)$, i.e. the subdirect representation (1) of $R$ is irredundant in the sense that none of $\mathrm{R}_{\alpha}$ can be omitted from (1). Setting $\mathrm{S}=\underset{\alpha \in \mathrm{A}}{\oplus} \mathrm{S}_{\alpha}$ we have

$$
\begin{equation*}
\mathrm{Ann}_{\mathrm{R}} \mathrm{~S}=0 . \tag{3}
\end{equation*}
$$

Since $S_{\alpha}$ is an ideal of $R_{\alpha}$ (and of $R$ ), $S$ is an ideal of $R . R_{\alpha}$ is even a rational extension of $\mathrm{S}_{\alpha}$ (both viewed as right $\mathrm{R}_{\alpha}$-modules (notation: $\mathrm{S}_{\alpha} \subseteq_{r} \mathrm{R}$ ) and for a similar reason we have $S \subseteq_{r} R$. This implies that $R_{\alpha}$ is an essential extension of the right $\mathrm{R}_{\alpha}$-module $\mathrm{S}_{\alpha}$ (notation: $\mathrm{S}_{\alpha} \subseteq_{e} \mathrm{R}_{\alpha}$ ) and $\mathrm{S} \subseteq_{e} \mathrm{R}$.

Denoting the canonical projection $\mathrm{R} \rightarrow \mathrm{R}_{\alpha}$ by $\pi_{\alpha}$, $\operatorname{Ker} \pi_{\alpha}=\mathbf{P}_{\alpha}$, we conclude that $P_{\alpha}=A n n_{R} S_{\alpha}$. Let $M$ be a (right) R-module which is S -torsionfree
(*) Nella seduta del 13 marzo 1982.
in the sense that

$$
\begin{equation*}
\mathrm{Ann}_{\mathrm{M}} \mathrm{~S}=\{m \in \mathrm{M} \mid m s=0 \quad \text { for all } s \in \mathrm{~S}\}=0 \tag{4}
\end{equation*}
$$

We wish to have a representation of M as an irredundant subdirect product of $\mathrm{R}_{\alpha}$-modules $\mathrm{M}_{\alpha}$. To this end, we define

$$
\begin{equation*}
\mathrm{N}_{\alpha}=\mathrm{Ann}_{\mathrm{M}} \mathrm{~S}_{\alpha} \quad(\alpha \in \mathrm{A}), \tag{5}
\end{equation*}
$$

and we observe that

$$
\bigcap_{\alpha} \mathrm{N}=\bigcap_{\alpha} \mathrm{Ann}_{\mathrm{M}} \mathrm{~S}_{\alpha}=\operatorname{Ann}_{M}\left(\sum_{\alpha} \mathrm{S}_{\alpha}\right)=\mathrm{Ann}_{\mathrm{M}} \mathrm{~S}=0
$$

If we set $\mathrm{M}_{\alpha}=\mathrm{M} / \mathrm{N}_{\alpha}$, then we obtain a representation of M as a subdirect product of R -modules:

$$
\begin{equation*}
\mathrm{M} \cong \underset{\alpha \in \mathrm{~A}}{\times} \mathrm{M}_{\alpha} \tag{6}
\end{equation*}
$$

In case $M=R$, (6) specializes to (1). One can prove the following statements:
(i) $\mathrm{M}_{\alpha}$ is in a natural way an $\mathrm{R}_{\alpha}$-module; indeed $\mathrm{M}_{\alpha}\left(\operatorname{Ker} \pi_{\alpha}\right)=$ $=\mathbf{M}_{\alpha} \mathrm{P}_{\alpha}=0$.
(ii) $\mathrm{M}_{\alpha}$ is $\mathrm{S}_{\alpha}$-torsionfree; for if $m_{\alpha} \mathrm{S}_{\alpha}=0$, and $m \in \mathrm{M}$ has $m_{\alpha}$ as $\alpha$-coordinate, then $m \mathrm{~S}_{\alpha}=0$, i.e. $m \in \mathrm{~N}_{\alpha}$ and $m_{\alpha}=0$.

Then one can prove the following theorem (see: Fuchs-Loonstra [1]):
1.1. Let R be a ring as above. If M is an S -torsionfree R -module, then the non-zero $\mathrm{M}_{\alpha}$ 's in (6) yield an irredundant representation of M as a subdirect product of $\mathrm{S}_{\alpha}$-torsionfree $\mathrm{R}_{\alpha}$-modules $\mathrm{M}_{\alpha}$.

## 2. SUbPRoducts and their decomposition

Among the submodules of a direct product the subdirect products play an important role. However-in general-not much is known about theit structure. In the case of a subdirect product $M$ of two $R$-modules $M_{1}, M_{2}$ we know that there exists an R-module $F$ and two R-epimorphism $\alpha_{1}, \alpha_{2} ; \alpha_{1}$ : $\mathrm{M}_{1} \rightarrow \mathrm{~F}, \alpha_{2}: \mathrm{M}_{2} \rightarrow \mathrm{~F}$, such that M can be represented as $\mathrm{M}=\left\{\left(m_{1}, m_{2}\right)\right\}$ $\left.\alpha_{1} m_{1}=\alpha_{2} m_{2}\right\}$.

In general, a subdirect product $M=\underset{a}{x} \mathbf{M}$ of more than two R -modules $\mathrm{M}_{\alpha}$ is not such a special subdirect product, i.e. there does not always exist a module $F$ and epimorphisms $\phi_{\alpha}: M_{\alpha} \rightarrow F(\alpha \in A)$ such that $M$ is the R-module of
elements $m=\left(\cdots, m_{\alpha}, \cdots, m_{\beta}, \cdots\right) \in \prod_{\alpha \in \mathrm{A}} \mathrm{M}_{\alpha}$ with the property

$$
\cdots=\phi_{\alpha} m_{\alpha}=\cdots=\phi_{\beta} m_{\beta}=\cdots
$$

For more than two modules-in general-no satisfactory description of subdirect products is even available. In the finite case, however, we know more of the submodules of a direct $\operatorname{sum} \underset{i=1}{\oplus} \mathbf{M}_{i}$. If $\mathbf{M}$ is any submodule of $\mathrm{M}^{*}=\underset{i=1}{\oplus} \mathrm{M}_{i}$ (M not necessarily a subdirect sum), then we have, for each $i=1, \cdots, k$, a homomorphism

$$
\alpha_{i}: \mathbf{M}_{i} \rightarrow \mathbf{F}=\mathbf{M}^{*} / \mathbf{M}\left(\alpha_{i} m_{i}=\boldsymbol{m}_{i}+\mathbf{M}\right),
$$

such that $\left(m_{1}, m_{2}, \cdots, m_{k}\right) \in \mathbf{M}^{*}$ belongs to M exactly if

$$
\alpha_{1} m_{1}+\alpha_{2} m_{\stackrel{ }{ }}+\cdots+\alpha_{k} m_{k}=0 .
$$

This idea will be generalized in the following. Therefore we start
(i) with a ring R admitting a decomposition (1) as subdirect product $R=\underset{\alpha \in A}{\times} R_{\alpha}$ with the properties (2): $\operatorname{Ann}_{\mathrm{R}_{\alpha}} \mathrm{S}_{\alpha}=0(\forall \alpha \in A)$ and
(ii) with a right R-module $\mathbf{M}$ which is S-torsionfree.

We have seen (see 1.1) that M can be represented as a subdirect product of $\mathrm{R}_{\alpha}$-modules $\mathrm{M}_{\alpha}$, where $\mathrm{M}_{\alpha}=\mathrm{M} / \mathrm{N}_{\alpha}, \mathrm{N}_{\alpha}=\mathrm{Ann}_{\mathrm{M}} \mathrm{S}_{\alpha}(\alpha \in \mathrm{A}), \mathrm{Ann}_{M_{\alpha}} \mathrm{S}_{\alpha}=0$ ( $\alpha \in \mathrm{A}$ ). It may happen that some of the $\mathrm{M}_{\alpha}$ in the decomposition of M are zero; therefore we omit the irredundancy of the decomposition.

Suppose that M and F are both S-torsionfree R-modules ( R as above) and $\phi: \mathrm{M} \rightarrow \mathrm{F}$ an R -epimorphism. Then using the decompositions $\mathbf{M}=\underset{\alpha}{\underset{\alpha}{x}} \mathbf{M}_{\alpha}, \mathbf{F}=\underset{\alpha}{\underset{\alpha}{x}} \mathbf{F}_{\alpha}$ we prove that $\phi$ induces-for each pair ( $\mathrm{M}_{\alpha}, \mathrm{F}_{\alpha}$ ) an R-epimorphism $\phi_{\alpha}: \mathbf{M}_{\alpha} \rightarrow \mathrm{F}_{\alpha}(\alpha \in A)$. Indeed, $\mathbf{M}_{\alpha}=\mathbf{M} / \mathbf{N}_{\alpha}$, $\mathrm{N}_{\alpha}=\mathrm{Ann}_{\mathrm{M}} \mathrm{S}_{\alpha}, \quad \mathrm{F}_{\alpha}=\mathrm{F} / \mathrm{K}_{\alpha}, \quad \mathrm{K}_{\alpha}=\mathrm{Ann}_{\mathrm{F}} \mathrm{S}_{\alpha}$. Then

$\mathrm{F}=\cdots \underset{\sim}{x} \mathrm{~F}_{\alpha} \underset{\sim}{\underset{\sim}{x}} \cdots$ $\mathrm{N}_{\alpha}=\left\{\boldsymbol{m} \in \mathrm{M} \mid m \mathrm{~S}_{\alpha}=0\right\}, \mathrm{K}_{\alpha}=\left\{f \in \mathrm{~F} \mid f \mathrm{~S}_{\alpha}=0\right\}$.

If $m \in \mathrm{~N}_{\alpha}$ then $\phi(m) \in \mathrm{K}_{\alpha}$, since $\phi(m) \mathrm{S}_{\alpha}=\phi\left(m \mathrm{~S}_{\alpha}\right)=0$. This mean s that $\phi\left(\mathrm{N}_{\alpha}\right) \subseteq \mathrm{K}_{\alpha}$, and since $\phi$ is an epimorphism, $\phi$ induces an epimorphism $\phi_{\alpha}: \mathrm{M}_{\alpha} \rightarrow \mathrm{F}_{\alpha}$, defined by $\phi_{\alpha}\left(m+\mathrm{N}_{\alpha}\right)=\phi(m)+\mathrm{K}_{\alpha}$, or $\phi_{\alpha}\left(m_{\alpha}\right)=\phi(m)+$ $+\mathrm{K}_{\alpha}=f_{\alpha} \in \mathbf{F}_{\alpha}$.

The epimorphism $\phi_{\alpha}$ is an R-epimorphism of the R -module $\mathrm{M}_{\alpha}$ onto the R -module $\mathrm{F}_{\alpha}$; we may even consider $\phi_{\alpha}$ as an $\mathrm{R}_{\alpha}$-epimorphism of the $\mathrm{R}_{\alpha}$-module $\mathrm{M}_{\alpha}$ onto the $\mathrm{R}_{\alpha}$-module $\mathrm{F}_{\alpha}$. Indeed: if $\boldsymbol{m}_{\alpha} \boldsymbol{r}_{\alpha}=\boldsymbol{m}_{\alpha} r$, and, in a similar way, $f_{\alpha} r_{\alpha}=f_{\alpha} r$, then we have:

$$
\phi_{\alpha}\left(m_{\alpha} r_{\alpha}\right)=\phi_{\alpha}\left(m_{\alpha} r\right)=\phi_{\alpha}\left(m_{\alpha}\right) r=f_{\alpha} r=f_{\alpha} r_{\alpha} .
$$

That implies
(i) the R-epimorphism $\phi: \mathrm{M} \rightarrow \mathrm{F}$ induces (uniquely) $\mathrm{R}_{\alpha}$-epimorphisms $\phi_{\alpha}: \mathrm{M}_{\alpha} \rightarrow \mathrm{F}_{\alpha}(\alpha \in \mathrm{A})$, and
(ii) the diagram (*), where $\rho_{\alpha}: \mathrm{F} \rightarrow \mathrm{F}_{\alpha}$ is the canonical projection $\rho_{\alpha}: \mathrm{F} \rightarrow \mathrm{F} / \mathrm{K}_{\alpha}=\mathrm{F}_{\alpha}$ is commutative.

Suppose that we have the R-modules $\mathrm{M}^{(i)}(i \in \mathrm{I})$,
 F and R -epimorphisms $\dot{\phi}^{(i)}: \mathrm{M}^{(i)} \rightarrow \mathrm{F} \quad(i \in \mathrm{I}) ; \mathrm{R}$ is again as above and the modules $\mathrm{M}^{(i)}(i \in \mathrm{I})$ and F are S-torsionfree.

We consider the R-module $\mathrm{M} \subseteq \mathrm{M}^{*}=\Pi \mathrm{M}^{(i)}$, consisting of those elements $m=\left(m^{(i)}\right) \in \mathbf{M}^{*}$, satisfying the relations ${ }^{i}$

$$
\left\{\begin{align*}
&\left.\phi^{\left(i_{1}\right)}\left(m^{\left(i_{1}\right)}\right)+\phi^{\left(i_{2}\right)}\right)\left(m^{\left(i_{2}\right)}\right)+\cdots \phi^{\left(i_{i}\right)}\left(m^{\left.(i)^{2}\right)}\right)=0  \tag{8}\\
& \phi^{\left(i_{1}^{\prime}\right)}\left(m^{\left(i_{1}^{\prime}\right)}\right)+\cdots \\
& \cdots \cdots \cdots \cdots \cdots=0 \\
& \cdots \cdots \cdots=0
\end{align*}\right.
$$

each relation of (8) consisting of finitely many terms. $\mathbf{M}$ is an R-submodule of $\mathbf{M}^{*}$ and is called a general subproduct of the $\left\{\mathbf{M}^{(i)}\right\}$, determined by the $\left\{\phi^{(i)}\right\}$ and the relations (8) and denoted by

$$
\mathrm{M}=\left\{\mathrm{M}^{(i)} ; \phi^{(i)} ; \mathrm{F} \mid i \in \mathrm{I}\right\}
$$

Under the conditions that all $\mathrm{M}^{(i)}$ and F are S-torsionfree, M is also S-torsionfree.

Indeed, we have $\mathrm{Ann}_{\mathrm{M}^{(i)}} \mathrm{S}=0(i \in \mathrm{I})$ and $m \mathrm{~S}=\left(\cdots, m^{(i)}, \cdots\right) \mathrm{S}=0$ implies $m^{(i)} \mathrm{S}=0$, and that means that all $m^{(i)}=0$, since the $\mathrm{M}^{(i)}$ are S-torsionfree. But then also M is S -torsionfree.

For each $\mathrm{M}^{(i)}(i \in \mathrm{I})$ we have a decomposition as a subdirect product

$$
\mathbf{M}^{(i)}=\underset{\alpha \in \mathbf{A}}{\times} \mathbf{M}_{\alpha}^{(i)} \quad(i \in \mathrm{I})
$$

where the $\mathrm{M}_{\alpha}^{(i)}$ are also $\mathrm{R}_{\alpha}$-modules and $\mathrm{S}_{\alpha}$-torsionfree.
(1) See e.g. L. Fuchs-F. Loonstra [2] and F. Loonstra [3], [4].

Using the results (i) and (ii) (of p. 4) we see that the diagram (7) induces (for each $a \in \mathrm{~A}$ ) a diagram (7a)

such that the corresponding R-homomorphisms $\phi_{\alpha}^{(i)}: \mathrm{M}_{\alpha}^{(i)} \rightarrow \mathrm{F}_{\alpha}(i \in \mathrm{I})$ can be considered as $\mathrm{R}_{\alpha}$-epimorphisms, where

$$
m_{\alpha}^{(i)} r_{\alpha}=m_{\alpha}^{(i)} r, \quad \text { if } \quad r_{\alpha}=\pi_{\alpha} r,
$$

and

$$
\phi_{\alpha}^{(i)}\left(m_{\alpha}^{(i)} r_{\alpha}\right)=\phi_{\alpha}^{(i)}\left(m_{\alpha}^{(i)}\right) r=f_{\alpha}^{(i)} r=f_{\alpha}^{(i)} r_{\alpha} .
$$

The epimorphisms $\phi^{(i)}(i \in \mathrm{I})$ and the relations (8) determine (for each $\alpha \in \mathrm{A})$ uniquely the epimorphisms $\phi_{\alpha}^{(i)}$ and the relations

$$
\begin{cases}\phi_{\alpha}^{\left(i_{1}\right)}\left(m_{\alpha}^{\left(i_{1}\right)}\right)+\phi_{\alpha}^{\left(i_{2}\right)}\left(m_{\alpha}^{\left(i_{2}\right)}\right)+\cdots+\phi_{\alpha}^{\left(i_{2}\right)}\left(m_{\alpha}^{(i)}\right) & =0  \tag{8a}\\ \cdots \cdots \cdots \cdots \cdots \cdots & =0 \\ \cdots \ldots \ldots \ldots \ldots & \\ & =0\end{cases}
$$

Indeed, we have $\phi_{\alpha}^{\left(i_{1}\right)}\left(m_{\alpha}^{\left(i_{1}\right)}\right)=\phi^{\left(i_{1}\right)}\left(m^{\left(i_{1}\right)}\right)+\mathrm{K}_{\alpha}$, and addition gives

$$
\phi_{\alpha}^{\left(i_{1}\right)}\left(m_{\alpha}^{\left(i_{1}\right)}\right)+\phi_{\alpha}^{\left(i_{2}\right)}\left(m_{\alpha}^{\left(i_{2}\right)}\right)+\cdots+\phi_{\alpha}^{\left(i_{1}\right)}\left(m_{\alpha}^{(i l)}\right)=0+\mathbf{K}_{\alpha}=0 \in \mathbf{F}_{\alpha}, \quad \text { etc. }
$$

One proves, just as for M , that the $\mathrm{R}_{\alpha}$-modules $\mathrm{M}_{\alpha}$, determined by (7a) and ( $8 a$ ), are $\mathrm{S}_{\alpha}$-torsionfree $(\forall \alpha \in \mathrm{A})$. Summarizing we proved that
2.1. The general subproduct M , defined by (7) and (8), has the following properties:
(i) M is an S-torsionfree R-module;
(ii) (7) and (8) determine (for each $\alpha \in \mathrm{A}$ ), systems (7a) and (8a), i.e. they determine $\mathrm{S}_{\alpha}$-torsionfree $\mathbf{R}_{\alpha}$-modules $\mathbf{M}_{\alpha}$ (for each $\alpha \in \mathrm{A}$ ).

We prove that $M$ can be represented as a subdirect product $M=\underset{\alpha}{\times} M$, and-denoting the canonical projections $\mathrm{M} \rightarrow \mathrm{M}_{\alpha}$ by $\Pi_{\alpha}-$ that $\operatorname{Ker}\left(\Pi_{\alpha}\right)=$ $=\mathrm{Ann}_{\mathrm{M}}\left(\mathrm{R} \cap \mathrm{R}_{\alpha}\right), \quad \alpha \in \mathrm{A}$.

Proof. If $m=\left(m^{(i)}\right)$ satisfies (7) and (8), then $m_{\alpha}=\left(m_{\alpha}^{(i)}\right)$ is a solution of (7a) and (8a). If we map therefore $m \mapsto\left(\cdots, m_{\alpha}, \cdots\right)$, then it is clear that M is a subdirect product of the $\mathbf{M}_{\alpha}(\alpha \in A)$. We prove even that the decomposition $\mathbf{M}=\underset{a \in A}{\times} \mathbf{M}$ is the canonical decomposition corresponding with the canonical
representation $R=\underset{\sim}{\alpha} \underset{\alpha}{x} R_{\alpha}$ of . Therefore we prove that the kernels of the canonical projections $\Pi_{\alpha}: M \rightarrow M_{\alpha}$ are

$$
\operatorname{Ker}\left(\Pi_{\alpha}\right)=\operatorname{Ann}_{M}\left(\mathrm{R} \cap \mathrm{R}_{\alpha}\right)=\mathrm{Ann}_{M} \mathrm{~S}_{\alpha} .
$$

$$
\begin{array}{r}
\mathrm{Ann}_{\mathbf{M}} \mathrm{S}_{\alpha}=\left\{m \in \mathbf{M} \mid m\left(0,0, \cdots, 0, r_{\alpha}, 0, \cdots\right)=0, \quad \forall r_{\alpha} \in \mathrm{R} \cap \mathrm{R}_{\alpha}\right\}= \\
=\left\{\left(\boldsymbol{m}^{(1)}, m^{(2)}, \cdots, m^{(i)}, \cdots\right) \in \mathbf{M} \mid\left(\cdots, m^{(i)}, \cdots\right)\left(0,0, \cdots, r_{\alpha}, 0, \cdots\right)=0,\right. \\
\left.\forall r_{\alpha} \in \mathrm{R} \cap \mathrm{R}_{\alpha}\right\}
\end{array}
$$

and i.e.

$$
m_{\alpha}^{(i)} \in \mathrm{N}_{\alpha}^{(i)}=\mathrm{Ann}_{\mathrm{M}^{(i)}} \mathrm{S}_{\alpha} \quad(i \in \mathrm{I})
$$

Therefore $\operatorname{Ker}\left(\Pi_{\alpha}\right)=\operatorname{Ann}_{M} \mathrm{~S}_{\alpha}=\left\{\boldsymbol{m}=\left(\boldsymbol{m}^{(i)}\right) \mid m^{(i)} \in \mathrm{N}_{\alpha}^{(i)} ; i \in \mathrm{I}\right\}$, where

$$
\mathrm{N}_{\alpha}^{(i)}=\left\{\boldsymbol{m}^{(i)} \in \mathrm{M}^{(i)} \mid \boldsymbol{m}^{(i)} \in \mathrm{Ann}_{\mathrm{M}^{(i)}} \mathrm{S}_{\alpha}\right\}
$$
